1 Introduction

T7 is a state-of-the-art trading architecture developed by Deutsche Börse Group. T7 offers high performance together with reliable connectivity, enriched trading functionality, as well as a faster time-to-market. The T7 trading architecture is used to operate the derivatives markets as well as the cash markets.

This document provides an overview of the T7 trading architecture's functionality with all its interfaces. Please refer to the "Functional Reference" for extensive information.

1.1 Purpose of this document

This document describes the main capabilities of T7's trading architecture used for both the cash and derivatives markets. The following reflects the main functionalities:

- Concept of multiple markets, products and instruments (incl. states)
- Concept of participant, business unit and user set-up
- Overview of on-book functionality
- Overview of off-book functionality (T7 Entry Service, Eurex EnLight, Xetra EnLight, Baskets)
- Overview of interfaces for trading and market data respectively for reference data

1.2 Further reading

The following documents provide additional information:

Overview and Functionality
• T7 Functional and Technical Release Notes for Eurex (Final). • T7 Functional and Technical Release Notes for Cash Market (Final). • T7 Functional Reference. • T7 Participant and User Maintenance Manual, for Derivatives Markets. • T7 Participant and User Maintenance Manual, for Cash Markets. • Market Model Continuous Trading in connection with Auctions. • Market Model Continuous Auction.
Interfaces
• T7 Trading + Admin GUI & Clearer GUI - User Manual, for Derivatives Markets. • T7 Trading + Admin GUI & Clearer GUI - User Manual, for Cash Markets. • T7 Market and Reference Data Interfaces Manual. • T7 Enhanced Order Book Interfaces Manual. • T7 Enhanced Trading Interface (ETI) – Derivatives Message Reference. • T7 Enhanced Trading Interface (ETI) – Cash Message Reference. • T7 FIX LF Interface – Derivatives Message Reference. • T7 FIX LF Interface – Cash Message Reference.
Reports
• T7 XML Report Reference Manual. • Common Report and Upload Engine User Guide.

Table 1: Further Reading

All the documents are available on the websites of Deutsche Börse Group:

1.3 Definitions and Abbreviations

The following are the definitions and abbreviations used in the Functional and Interface Overview:

Abbreviation or Term	Definition
BU	Business Unit
CCP	Central Counterparty
CM	Clearing Member, i.e., a participant with a specific Clearing Business Unit
DBAG	Deutsche Börse AG
DC market participant	Direct client; formerly known as non-clearing member NCM
ECAG	Eurex Clearing AG
EDC	Enhanced Drop Copy service via the EDC interface
EEX	European Energy Exchange
EMDI	T7 Enhanced price level aggregated Market Data Interface
EMDS	T7 Extended Market Data Service
EOBI	T7 Enhanced Order Book Market Data Interface
ETC	Exchange Traded Commodity
ETF	Exchange Traded Fund
ETI	Enhanced Trading Interface
ETN	Exchange Traded Note
Eurex EnLight	A selective request for quote service, to negotiate off-book transactions
FIX	Financial Information eXchange (Protocol)
Frankfurt	Frankfurt Stock Exchange's trading venue Deutsche Börse Frankfurt on T7
GUI	Graphical User Interface

Abbreviation or Term	Definition
HF	High Frequency session
LF	Low Frequency session
IPS	Inter-product Spread
LP	Liquidity Provider
MDI	T7 netted price level aggregated Market Data Interface
Nodal	Nodal Exchange
Off-book	Refers to trading functionality not involving the central order book
On-book	Refers to trading functionality of the central order book
ORL	Overall Risk Limits (SpA)
PAG	Product Assignment Group
PLP	Passive Liquidity Protection
PWT	Price without turnover, e.g., PWT quote
RDF	Reference Data File
RDI	Reference Data Interface
RDS	Reference Data System
RfQ	Request for Quote
SI	Settlement Institution
SMP	Self-match Prevention
SpA	Sponsored Access
SRQS	Selective Request for Quote Service; see Eurex EnLight / Xetra EnLight
T7	Cash & Derivatives trading system developed by Deutsche Börse Group
TES	T7 Entry Service
WBAG	Wiener Börse AG
Xetra	Frankfurt Stock Exchange's trading venue Deutsche Börse Xetra on T7
Xetra EnLight	A selective request for quote service, to negotiate off-book transactions

2 Main Components

The following chapter describes the main components of the T7 trading architecture.

2.1 Markets, Products and Instruments

The T7 trading architecture provides the capability to operate multiple markets (such as Eurex, Xetra, EEX) on one technical instance. The following figure shows the T7 market hierarchy with its markets, product assignment groups, products and instruments:

Figure 1: T7 Market Hierarchy

Instruments in T7 are the tradeable entities, i.e., an order refers to buying or selling a specified quantity of a certain instrument. Instruments of the same type are grouped to form products. However, every instrument must belong to a product. The product itself is associated with a product assignment group. For instance, the product assignment group “German Interest Rate Futures & Options” contains the Eurex products FGBL, FGBM, FGBS, FGBX, OGBL, OGBM, and OGBS. A simple instrument would be FGBL DEC 2026.

The product assignment group is used for Entitlement except in Deutsche Börse Frankfurt. Please refer to section 2.4.3 for more details. Each product assignment group refers to a specific market.

Please note that a product may contain only one instrument (relation 1:1). For example, the product assignment group DAX1 comprises all DAX products such as ADS, ALV, BASF, BMW etc. In turn, the product ADS includes the simple instrument ADS. – In Deutsche Börse Frankfurt, a product may contain tens of thousands of instruments.

A product and its instruments always belong to a single market.

2.2 Instrument Types

This section introduces instrument types in T7. In general, it is distinguished between three instrument types referred to as “**Simple Instrument**”, “**Complex Instrument**” and “**Flexible Instrument**”.

The following figure represents an overview of the cash and derivatives markets:

	Derivatives Market	Cash Market
Simple Instruments	Futures Contracts Option Series	Equities, Exchange Traded Funds, Exchange Traded Commodities, Exchange Traded Notes, Money Market Funds, Investment Funds, Bonds, Warrants, Subscription Rights, Covers
Complex Instruments	Futures Spreads Standard Futures Strategies Packs and Bundles Strips Commodity Strips Inter-Product Spreads Standard Options Strategies Non-Standard Options Strategies Options Volatility Strategies Non-Standard OVS TRF Strategies	-
Flexible Instruments	Flexible Futures, Flexible Options	-

Figure 2: Instrument Types on T7

The cash markets use only simple instruments (e.g., equities, ETFs, ETCs, ETNs).

Instrument Covers (“Hüllen”) can be listed by Issuers on T7 as intraday or long-term covers. Cover instruments are supported only for cash markets in the trading model *Continuous Auction with Specialist* resp. *with Market Maker*. Covers become tradable only and immediately upon the activation by the issuer, who can update certain instrument attributes with the activation. An activated cover will never be reverted to a cover.

Simple instruments in the derivatives markets can be individual futures contracts or options series.

Scaled instruments in derivatives markets are simple or complex instruments with a round-lot condition.

Complex instruments enable trading of two or more simple instruments simultaneously.

Flexible instruments are tailor-made futures or options contracts. They can be traded only off-book via T7 Entry Services.

The following table defines the supported complex instrument types:

Complex Instrument Type	Description
Futures Spread	Calendar spread combinations for futures.
Packs and Bundles	Futures strategies containing consecutive quarterly maturities.
Strip	Futures strategy similar to packs and bundles with 2 - 20 legs.
Commodity Strip	Focused on the trading of commodity products such as power futures.
Standard Futures Strategy	Analogous to Standard Options Strategy. Currently, T7 supports two Standard Futures Strategies: Futures Butterfly and Futures Condor.
Inter-Product Spread (IPS)	Combination of contracts of different futures products of the same market.
Standard Options Strategy (SOS)	Strategies with up to four legs which conform to standard rules (e.g., Bull, Bear, Straddle).
Non-Standard Options Strategy (NOS)	Any combination of simple options instruments, not covered by a Standard Options Strategy, with up to six legs.
Standard Options Volatility Strategy (OVS)	Volatility strategies with up to six legs plus underlying (e.g., Call vs. Underlying, Put vs. Underlying, Bull vs. Underlying).
Non-Standard Options Volatility Strategy (NOVS)	Similar to Options Volatility Strategies, but more flexible by allowing a non-standard Options Strategy which is not covered by a strategy template of OVS.
TRF Strategy	TRF Strategies for trading on-book and off-book in Total Return Futures (TRF). TRF strategies have at least one leg being a Total Return Futures instrument. Available subtypes include delta-neutral strategies and Forward Implied Spreads.

Table 2: Complex Instrument Types

Usually complex instruments are requested by traders. However, some futures spreads, packs and bundles and inter-product spreads are created by the exchange.

2.3 Trading States

This section provides an overview of the trading states supported by T7. Overall, T7 supports two trading states, i.e. the “**product state**” and the “**instrument state**” which are explained in the following sections.

2.3.1 Product States

With the help of the product state, the business day is structured in a timely manner and the overall access to the trading system is controlled on product level. The following table represents typical product states for a common trading day:

Product State	Description
Start of Day	➤ Represents the time in the morning before activity begins. ➤ Participants have no functional access to the trading system.
Pre-Trading	➤ Represents the phase before trading starts providing traders the possibility to prepare themselves for trading in terms of order maintenance (without execution).
Trading	➤ Represents the trading phase during the day where order execution is possible and market data is available. ➤ Different trading models as well as auction call and freeze phases are supported.
Closing	➤ Phase between Trading and Post-Trading phase which covers the time between the end of regular trading and the end of the closing auction, or the end of the Trade-at-Close phase (cash markets only). ➤ For products that have no closing auction at the end of the trading phase, the product state Closing has normally a zero duration.
Post-Trading	➤ State in the evening after trading has ended. It is typically a time where traders can maintain their orders in preparation for the next trading day (no execution).
End of Day	➤ Phase in the evening reserved for the end-of-day processing by the exchange. ➤ Participants have no access to the trading system anymore.

Table 3: Overview of Product States

For Retail Early and Late Trading, there are two additional phases between Pre-Trading and Trading, and between Closing and Post-Trading:

Product State	Description
Retail Early Trading	➤ Trading of Retail orders and quotes. ➤ Auction model. ➤ Non-Retail orders and quotes do not take part in trading but can be maintained like in Pre-Trading.
Retail Late Trading	➤ Trading of Retail orders and quotes. ➤ Auction model. ➤ Non-Retail orders and quotes do not take part in trading but can be maintained like in Post-Trading.

Additionally, T7 supports two other product states for specific situations:

Product State	Description
Halt	➤ The exchange may halt a product if it deems that market conditions or technical conditions require this. In this product state, no trading occurs and access to the order book is restricted.
Holiday	➤ This product state applies to products that are not open for trading on that day, even though the exchange is open. Participants have no access to the trading system for a product that is in the product state Holiday.

Table 4: Special Product States

2.3.2 Instrument States

The instrument state refers to the individual state of the instrument and controls the trade activity in the order book as well as the market data distribution. The following figure shows the typical sequence of instrument states in the normal continuous trading model. However, T7 also supports other trading models/ forms as used for the cash markets. See e.g., the One Auction trading model as displayed in the figure.

Please refer to the Market Model documents as mentioned in 1.2 *Further Reading* for more information regarding trading models / trading forms in the cash markets.

See figure on the next page.

Figure 3: Typical Product and Instrument States (simplified)

The table below describes the instrument states referred to above:

Instrument State	Description
Closed	No access to the order book, no executions and no data distribution.
Book	Order/ quote maintenance is possible but no executions and no data distribution.
Continuous	Order/ quote maintenance as well as continuous matching of orders and quotes are possible. Trade data is published by the exchange.
Pre-Call	The instrument state Pre-Call serves as preliminary phase in the run-up to auction phases in <i>Continuous Auction</i> trading models. In <i>Continuous Auction with Market Maker</i> trading model, immediate matching is possible in Pre-Call within the limits of the Liquidity Provider's quote.
Opening/ Intraday/ Closing Auction	Order/ quote maintenance is possible but no executions. Only top of the book is published (either best bid/ ask or the potential auction price). It is possible that within an opening/ intraday or a closing auction, a volatility auction is triggered if the auction price is outside a predefined price range. A special case of an auction is Auction-Call in the trading model <i>Continuous Auction with Market Maker</i> .
Trade-at-Close	The instrument phase Trade-at-Close is a potential continuous trading phase following a closing auction with successful price determination and positive turnover in the trading model <i>Continuous Trading with Auctions</i> . Matching is possible only at the fixed closing auction price. Trades executed during the Trade-at-Close phase are flagged accordingly.

Table 5: Time Triggered Instrument States

For Retail Early and Late Trading, there are two additional instrument states:

Instrument State	Description
Retail Pre-Call	Preliminary phase in the run-up to Retail Call auction phases in Retail Early and Late Trading phases.
Retail Call	Retail Call is an auction instrument state entered from instrument state Retail Pre-Call. The termination of the Retail Call phase will always be time-triggered with random end.

Further instrument states may occur throughout the trading day, which are event triggered:

Instrument State	Description
Volatility Auction	Order/ quote maintenance are possible but no executions. At least top of the book is published (either best bid/ ask or the potential auction price), depending on the exchange configuration. Volatility auctions occur if the potential execution price is outside a predefined price range.
Restricted	Only deletions are possible (no order/ quote maintenance, no executions, no data distribution). In certain markets, instruments enter the state Restricted when the product is set to Halt.
Freeze	No order/ quote maintenance and no executions are possible. Deletions are marked as 'pending'. Top of the order book is published (either best bid/ ask or the potential auction price). After the freeze, a potentially resulting trade is published. This state is used by the exchange to check the order book specifically. For the cash markets, this state occurs typically at the end of an extended volatility interruption. A special case is the Freeze phase in trading model <i>Continuous Auction with Specialist</i> by which the Specialist arranges matching and price determination. Here, no market data is published, and matching-relevant order entry, modification, and deletion requests do not enter the order book but are kept in Locked Stock until the end of Freeze.

Table 6: Event triggered Instrument States

2.3.3 Fast Market

A Fast Market is declared by an exchange when a volatile market situation is expected. During this time, certain price controls are relaxed, e.g., minimum quote spread requirements.

In T7, Fast Market is a special status of the product that the exchange can set independently of the product and instrument states. This allows for example, a product to be set to Fast Market early in the morning before trading starts, without any impact on the sequence and timing of the product states.

2.3.4 Market Conditions

The states relevant for regulatory purposes of market conditions for market making are Normal Market Conditions, Stressed Market Conditions and Exceptional Circumstances. T7 publishes using the market data interfaces the Normal and Stressed Market Conditions. The Exceptional Circumstances are published only via news messages.

2.3.5 TES Activity Product Status

T7 applies trading status at both the product and instrument level. The TES activity status for a product determines which TES activities are allowed in the product. Please note that the product status for TES is independent of the product status for on-book trading. For a given product, the following values for the TES activity status are foreseen:

- **On** – When the TES activity status is “On” for a product then TES trade entry, TES trade modification, TES trade deletion and TES trade approval are allowed for all the instruments of the corresponding product.
- **Ended** – The TES activity status “Ended” terminates the TES trading session of a business day. All the pending TES trades (pending entries/ modifications/ deletions) are deleted during transition to the TES activity status “Ended”. TES trade entry/ modification/ approval and deletion are not allowed. It is still possible to enter pre-approved bilateral OTC uploaded trades during “Ended”.
- **Off** – The TES activity status “Off” indicates that the product is no longer available for TES trading or TES trading has not been started for the day. In this case, all TES activities are disabled for the product.
- **Halted** – The TES activity status “Halted” is reserved for emergency situations. The exchange may set the TES activity status to “Halted” for a product if they judge that market conditions or technical conditions impair the integrity of the market. In this state TES trade entry, modification, approval, and deletion are not allowed. Pending TES trades remain when the TES activity status is “Halted”.

Product States	TES Activity Status
Start of Day	OFF
Pre Trading	
Trading	ON
Closing	
Post Trading	
	Ended
End of Day	OFF

Figure 4: TES Activity Status

2.3.6 On-book and TES (Off-book) Instrument Status

In T7, the instrument *status* is different from the instrument *state*. The instrument status controls in principle if the instrument is available for trading or not. Thereby, it is distinguished between the instrument status for on-book and off-book trading, i.e. *TES* trading. Both can be determined separately, i.e. an instrument can be deactivated for on-book but not for TES trading.

The following instrument status are available in T7:

Instrument Status	Description
Active	The instrument status of an instrument to allow trading.
Inactive	The exchange may decide to deactivate an instrument during the day. Trading is fully deactivated.
Expired (for derivatives only)	Instruments that expire during the trading day, rather than at the end of the trading day (<i>Intraday Expiry</i>) will upon expiration acquire the listing status 'Expired' as opposed to 'Active'. Trading is not possible anymore; the instrument state is changed to 'Restricted'.
Delisted (for cash only)	Instruments with last trading date in the past; pending deletion. Trading is not possible anymore; the instrument state is changed to 'Restricted' resp. to 'Closed'.
Suspended	The exchange may suspend an instrument under unusual circumstances, or on "Knock-out-Locked". A suspended instrument will acquire the listing status 'Suspended' as opposed to Active. Trading is not possible anymore; the instrument state is changed to 'Restricted'.

Table 7: Instrument Status

2.4 Participant, User Concept & Entitlement

The participant structure in T7 consists of three hierarchical levels: The **Participant** on the first level, the **Business Unit** on the second level, and the **User** as well as the **Session** on the third level.

Figure 5: Participant hierarchy in T7

Definitions for the participant hierarchy:

- **Participant:** The Participant is the highest-level entity in the participant structure of T7. It is the participant legal firm and can be a trading participant, a clearing member, or a service provider.
- **Business Unit:** A participant may have several business units working independently. Two types of business units are distinguished:
 - **A Trading Business Unit** - used by trading participants for trading only.
 - **A Clearing Business Unit** - used by clearing members to receive trade confirmations from their own trading business units and from the trading business units of their related Direct Clearing participants.
Only for the cash markets: Users can make use of the Clearing Member Stop functionality.
Only for derivatives markets: For risk control purposes Pre-Trade Limits and Pre-Trade Limits View are available. Transaction Size Limits may be defined for Direct Clearing participants.

Each trading participant initially has just one trading business unit and each clearing member has just one clearing business unit. Participants providing both trading and clearing will get both a trading and a clearing business unit.
- **User(s):** A business unit can have multiple users. A user can be a trading user and/or an administrator.
- **Session(s):** Sessions are permanently registered connection channels to T7. A session is set up for and belongs to exactly one business unit. To send requests to the trading system, a user must use a session that is connected to T7 and that belongs to the same business unit as the user. Besides that, there is no further relationship between users and sessions, i.e. a user does not belong to a specific session and a session does not belong to a specific user. As long as the session belongs to the same business unit, users can use different sessions simultaneously.

2.4.1 User Concept

There are three user levels: **Trader**, **Head Trader** and **Supervisor**.

- **Traders** can enter/ modify/ delete their orders only.
- **Head Traders** are allowed to perform the following activities on-behalf of the traders in the same trader group.
 - modify and delete orders.
 - approve and delete pending TES trades
 - all the activity on Eurex EnLight or Xetra EnLight except entering the RfQ.
- **Supervisors** can perform the following activities on-behalf of the traders in the same business unit
 - modify and delete orders.
 - approve and delete pending TES trades
 - all the activities on Eurex EnLight or Xetra EnLight except entering the RfQ.

Quote ownership does not depend on the trader group, please refer to section 3.2 (Quotes).

With T7, users are configured by the participant for trading via the Admin GUI and for Clearing via the Clearing GUI. Users have to be registered via the *Member Section* and trading users must be activated by the exchange.

2.4.2 SpA User Concept

Each participant can offer a Sponsored Access (SpA) to indirect participants to trade on T7. The participant offering SpA access is called *SpA provider*, the indirect participant is called *SpA user company*. The users of the SpA user company are called *SpA traders*.

Dedicated SpA sessions are assigned to the SpA user companies. SpA providers can stop a SpA user company and optionally delete all its orders. With the Overall Risk Limits (ORL), there is a specific risk protection mechanism for Sponsored Access in cash markets, see chapter 7.

2.4.3 Entitlement

Entitlement in T7 is based on roles, in combination with product assignment groups or a market. The roles enable the participant to manage user resources more easily. For example, a trader role is enriched by all resources enabling the user to trade (e.g., enter order request, modify order request, etc.). Another example is the role of the "Service Administrator" enabling user maintenance.

The roles are assigned to the (trading/ clearing) business units by the exchange. From here, the business unit can inherit the entitlement to its users. It is possible that a user has more than one role, some effective market-wide and some per product assignment group. The following figure represents an overview of the entitlement:

Figure 6: User Entitlement Overview

Thus, it is possible that a user who has the “Trading View” role (i.e. only allowing to see trading information) in one product assignment group can act as Market Maker in another product assignment group.

The following overview provides an insight into all available roles in T7¹:

Roles	Relevant for ²				Description
	TBU	CBU	MKT	PAG	
Service Administrator (derivatives markets only)	x		x		Set up new users, maintain their entitlement as well as delete users, maintain TSLs for users.
User Data View (derivatives markets only)	x	x	x		Allows viewing of own user data information and of other users.
User Data View w/o PIN (derivatives markets only)	x		x		Allows viewing of own user data information and of other users, but no PIN view.
Trader (derivatives markets only)	x			x	Enables trading, e.g., enter orders.
Cash Trader (cash markets only)	x		◊	x	Enables trading, e.g., enter orders.
Cash Specialist	x		x		Enables acting as Specialist, i.e. to do quote

¹ For further details, please refer to the *T7 Participant and User Maintenance Manual Derivatives* respectively *Cash Markets*.

² TBU = Trading Business Unit, CBU = Clearing Business Unit, MKT = Market, PAG = Product Assignment Group. ◊ = For Deutsche Börse Frankfurt, the relevance is on Market, not on Product Assignment Group.

Roles	Relevant for ²				Description
	TBU	CBU	MKT	PAG	
(cash markets only)					maintenance, and to enter, modify resp. delete orders for other business units' users on behalf.
Sponsored Access Trader	x			x	Enables Trading for a Sponsored Access User Company trader.
Trading View (derivatives markets only)	x			x	Allows viewing own trades and orders, e.g., to inquire them.
Trading View (cash markets only)	x		◇	x	Allows viewing own trades and orders, e.g., to inquire about them.
TM Trade Overview	x		x		Allows viewing own trades, market view and OTSS, but no orders.
Market Maker Protection (derivatives markets only)	x			x	Allows to maintain Market Maker protection parameters and to delete quotes automatically if predefined parameters are exceeded, as a part of risk control.
Market Maker (derivatives markets only)	x			x	Enables Market Maker activities, e.g., enter quotes.
Cash Market Maker (cash markets only)	x			x	Enables Market Maker activities, e.g., enter quotes.
Cash Liquidity Provider (cash markets only)	x			x	Enables Issuers to use the Knockout functionality. The role is used for <i>Continuous Auction with Specialist</i> and <i>with Market Maker</i> .
Emergency Mass Deletion	x		x		Allows deleting all open orders and quotes.
Emergency Trading Stop	x		x		Allows stopping the entire trading business unit in case of emergency. All open orders/ quotes are deleted.
EmergencyTradingStop User 2EP	x		x		Allows stopping of users without 4EP. Otherwise the same as Emergency Trading Stop.
Qualified Back Office User	x		x		Allows stopping of Sponsored Access User Companies by SpA Service Providers via API.
Clearing Member Stop (cash markets only)		x	x		Allows users of clearing members to stop one or many of their related trading business units.
CM Backoffice View		x	x		Allows users to inquire trades of their related trading business units.
Trade Enrichment Rule	x		x		Enables to view and maintain trade enrichment rules. This feature is used for automatic enrichment of executed orders and quotes that use the short order message layout. TES trades are not affected.
Trade Enrichment Rule View	x		x		Enables to view all trade enrichment rules without update capability.
Pre-trade Limits	x		x		Enables users to view and maintain pre-trade limits for on-book trading, i.e. without impact on off-book TES trades.

Roles	Relevant for ²				Description
	TBU	CBU	MKT	PAG	
Pre-trade Limits View	x		x		Enabling to view all pre-trade limits without update capability.
TES Trader	x		◇	x	Allows to enter, modify and to delete a TES trade as well as to approve the own TES side. Enable trader to use Eurex / Xetra EnLight.
TES Broker	x		◇	x	Allows to enter, modify and delete a TES trade but not to approve a TES trade as a TES Broker is not involved as a counter party. Enables trader to use Eurex / Xetra EnLight.
Sponsored Access TES Trader (derivatives markets only)	x			x	Allows entering of TES trades by a Sponsored Access User Company trader.
TES View	x		◇	x	Allows viewing TES trades.
Cash Service Administrator (cash markets only)	x		x		Set up new users, maintain their entitlement as well as delete users. Maintain TES Auto Approval rule.
Cash User Data View (cash markets only)	x		x		Allows viewing of own user data information and of other users. View TES Auto Approval rule.
CM Pre-Trade Risk Maintenance		x	x		Enables a user to maintain and view all Risk Control parameters set for all Trading business units related to the Clearer.
CM Pre-Trade Risk View		x	x		Enables a user to view all Risk Control parameters set for all Trading business units related to the Clearer, but without update capability.
CM Service Administrator (derivatives markets only)		x	x		Set up new users, maintain their entitlement as well as delete users, maintain TSLs for NCMs
Enhanced Drop Copy Maintenance	x	x	x		Enabling maintenance of EDC configurations / authorization.
Enhanced Drop Copy View	x	x	x		Enabling view of EDC configurations / authorization
Overall Risk Limits Definition (Xetra Only)	x		x		Allows maintenance of Overall Risk Limits (ORL) by Sponsored Access Service Providers.
Overall Risk Limits View (Xetra only)	x		x		Allows viewing of defined Overall Risk Limits (ORL) by Sponsored Access Service Providers.

Table 8: Overview of Roles Functionality

3 On-book Functionality

This section describes the on-book functionality for the cash and the derivatives markets provided on T7.

3.1 Orders

T7 supports multiple types of orders to fulfill customer needs and expectations. All orders entered are anonymous, i.e. the business units do not receive any information on who entered an order.

Depending on the market and the traded instrument, the allowed combinations of order types, restrictions, price conditions and validities may differ. These combinations determine the exchange within an order profile disclosed to the customers in the reference data.

Nevertheless, there are two attributes which are mandatory and valid for all orders: the order persistency and if it is standard or a lean order. The following figure depicts the differences as well as the combination possibilities.

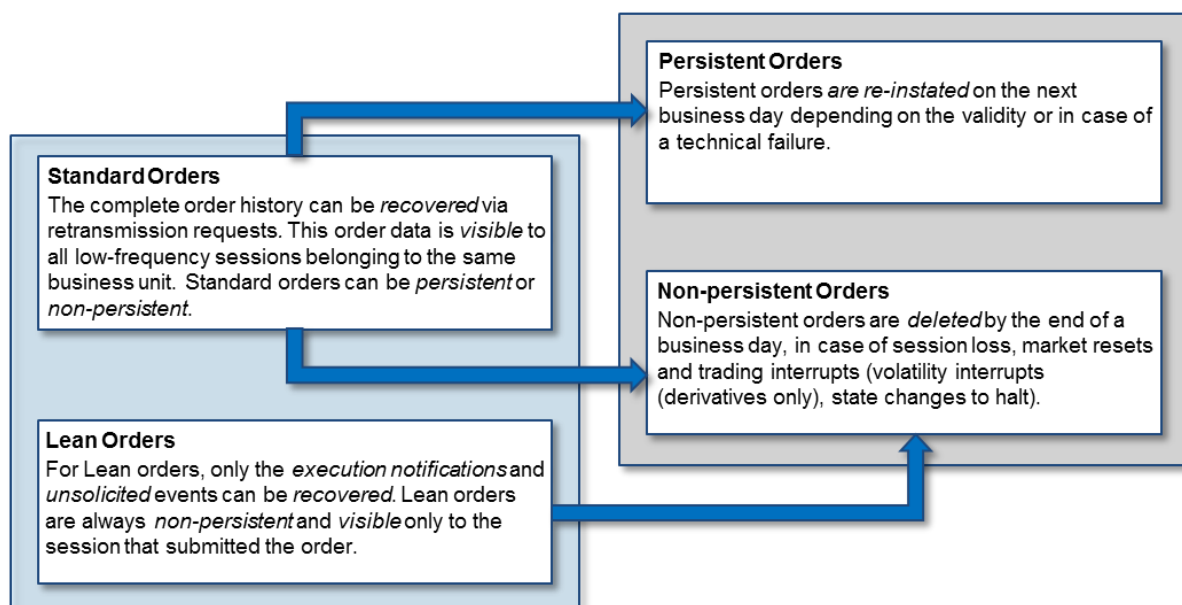

Figure 7: Standard/ Lean Orders vs. Persistent/ Non-persistent Orders

In Deutsche Börse Frankfurt, only persistent orders are allowed.

Overall, T7 supports the following order types, price conditions, restrictions and validities:

Order Price Condition	Description
Limit Order	A limit order is an order that does not get executed at a price worse than its limit.
Market Order	A market order is an order without price.

Table 9: Order Price Conditions

Order Type	Description
Regular Order	A regular Limit or Market order.
Stop Order	In case the market reaches the stop price, the stop order is triggered and routed to the order book. The stop order is available as a stop market and / or a stop limit order.
One-Cancels-the-Other Order (OCO)	The OCO combines the behavior of a limit order with that of a stop market order. On entry, it first behaves exactly like a Limit Order. Once the trigger condition is fulfilled, the OCO order behaves like a triggered Stop Market Order.
Iceberg Order (cash markets only)	Iceberg Orders are orders with quantities only partially visible, i.e. only visible with its peak in the order book. The refill of the peak after execution can be configured to be random.
Trailing Stop Order (cash markets only)	Trailing Stop Orders (TSO) behave like Stop Orders but having an absolute or relative distance between the stop limit and the current reference price (trailing amount). TSOs can be entered only as "Market". The stop limit of a TSO adjusts automatically according to the trailing amount until the trigger condition is fulfilled, and the TSO is triggered.
Midpoint Order	Midpoint orders enter the separate Midpoint order book, not the Central Limit Order Book (CLOB). If a Midpoint order is defined as a Midpoint Sweep order, it first enters the Midpoint order book, and if it is not completely matched in the Midpoint order book, the remainder of the order enters the CLOB as a Regular order.
Auction Volume Discovery Order (AVD)	Orders becoming active only in AVD uncrossings after auction uncrossings, matching among other AVD orders or the auction's surplus.

Table 10: Order Types

Order Restriction	Description
Auction Only	If this restriction is set, the order can only get executed during a scheduled auction phase but not during continuous trading or an (extended) volatility interruption.
Intraday Auction Only (cash markets only)	If this restriction is set, the order can only get executed during a scheduled intraday auction phase (this excludes volatility interruptions).
Opening Auction	If this restriction is set, the order can only get executed during the opening auction.
Closing Auction	If this restriction is set, the order can only get executed during the closing auction.
Main Trading Hours (cash markets only)	If this restriction is set, the order can only get executed during the Main Trading Hours, i.e. from Opening Auction until Closing Auction, including Trade-at-Close.
Special Auction (cash markets only)	If this restriction is set, the order can only get executed during a Special Auction
Book-Or-Cancel	Orders using the restriction Book-or-Cancel (BOC) are accepted and written only to the order book if its execution is not possible (fully/ partially) on entry. For derivatives, BOC is valid for quotes, too.
Midpoint-Book-Only (MBO) (cash markets only)	MBO Midpoint orders do not participate in any immediate midpoint matching upon entry. Instead, they are entered into the Xetra Midpoint order book entirely passively. The order may then participate in subsequent midpoint matches.
Counterparty-Resting-Time (CRT) (cash markets only)	CRT Midpoint orders are executed only against counterparty Midpoint orders, which have been passively resting in the Xetra Midpoint order book for at least a predefined minimum resting time period in <i>Continuous</i> trading as well as in a marketable state without interruption.

Table 11: Order Restrictions

Order Validity	Description
Good-for-Day	Orders entered "Good-for-Day" (GFD) are deleted at the end of the trading day they were entered on.
Good-till-Date	Orders entered "Good-till-Date" are valid until the date specified by the user. The order is then deleted automatically during the end of day processing of its last validity day.
Good-till-Cancelled	Orders entered "Good-till-Cancelled" (GTC) remain in the system until the deletion by the user itself.
Immediate-or-Cancel	For orders entered as "Immediate-or-Cancel" (IOC), the quantity that cannot be executed immediately upon entry, is deleted.
Fill-or-Kill	For "Fill-or-Kill" (FOK) orders either the total quantity is matched upon order entry or nothing is executed at all and the whole order is cancelled.

Table 12: Order Validity

Multi Order Fill-or-Kill

The Multi Order Fill-or-Kill functionality is a special order entry request to enter more than one limit order simultaneously with the condition that all orders are either completely executed or rejected simultaneously.

Trade-at-Close

An order needs to be explicitly flagged to participate in the Trade-at-Close phase (trading model *Continuous Trading with Auctions*, cash markets). Only market orders and limit orders with a limit price better or equal to the closing auction price can participate in Trade-at-Close.

Order Identification

An order can be tracked via the Order ID assigned to every order on entry. The Order ID is unique per product and does not change over the whole lifecycle of the order. This means that T7 may assign the same Order ID to orders belonging to different products. Please note in that context that the same security set up in different markets is assigned to separate products.

In addition to the Order ID, in the cash markets every order is assigned a System Order ID Version Number (starting with 0) which increases in case of a user-driven order modification which results in a priority change, e.g., in the case of

- changing the limit price,
- increasing the quantity,
- extending the validity.

For more information on order tracing, please refer to the document T7 Cross System Traceability.

Automatic Order deletions

In certain scenarios, the deletion of persistent and / or non-persistent orders and of quotes is triggered automatically. Some examples:

- Orders with expiring validity are deleted at the end of the business day.
- An order modification changing the total quantity to a value below the already executed quantity results in the deletion of the order.

- Session Disconnect.
- Member Stop.

3.2 Quotes

T7 supports both, one-sided and double-sided quotes. The following applies for quotes:

- Quotes belong to the session on which they are entered, refer to section 8.1.1. A business unit can have multiple sessions, each with its own quotes.
- The “mass quote” function allows the users to enter, overwrite and delete multiple quotes of a session simultaneously.
- T7 provides “quote entry” to replace an existing quote with the new quote. This is done by starting a new quote life cycle with an accumulated traded quantity set to zero. It also provides “quote modification”, which refers to an existing quote and preserves the accumulated traded quantity. The priority timestamp of a quote stored in the order book is changed when the price is changed, or when the open quote quantity is increased.
- The “delete all quotes” function can be used to delete all quotes in a product of a session, or of all sessions of a Business Unit.
- It is possible to deactivate and to delete all quotes of a session per product at the same time. In this case, all further mass quote requests for this session and product will be rejected until the session will be activated again for quoting for this product.
- Quotes for complex instruments are supported and can be mixed with quotes for simple instruments inside a single “mass quote” transaction.
- An incoming or a modified quote side which fails the price reasonability check, or the extended price range validation results in:
 - Rejection of the incoming or modified quote
 - Deletion of the old quote (i.e. with both sides) in the book belonging to that session and instrument.
- Quotes are always non-persistent and automatically deleted in specific situations. Please refer to the table “Order deletion scenarios” in section 3.1 including quotes as well. In difference to these scenarios, quotes are also deleted in case of an intraday expiry (derivatives markets only) while orders remain in the order book.
- All quotes of a session can be deactivated and reactivated. This feature can be applied for a specific product. When quotes of a session are deactivated, they are unavailable for matching, but can be updated while remaining inactive. During the time of the deactivation, any new quote entered into the session will also be deactivated. When quotes are (re-)activated they receive a new matching time priority.
The market maker protection functionality which is provided for the derivatives markets only uses this deactivation function.
- Incoming quotes which could potentially immediately match, are rejected, if the trader configures the quote as BOC quote, or if the Passive Liquidity Protection (PLP) is switched ON for this product.

- A Request for Quote (RfQ) is a request that is directed either to the entire market or to specific market makers, which indicates trading interest in a specific instrument. An RfQ can be single-sided or double-sided, and it can optionally carry a quantity. The exchange determines by product whether RfQs are supported.
- In the trading model *Continuous Auction for Market Maker*, there is also a non-binding Indicative quote.
- In the *Continuous Auction* trading model for Specialists and Market Makers, the Quote Request Solution (QRS) offers market participants the opportunity to request a full execution of an order at a defined or better price.

3.3 Trading Models & Matching

T7 has the capability to support different trading models or trading forms. A predominating trading model is the *Continuous Trading (with Auctions)* model. Besides that, T7 supports the trading model *Continuous Auction with Market Maker*, or the trading model *Continuous Auction with Specialist*, or the trading model *One Auction* which are set up for some products in the cash markets only.

However, in principle trading is arranged in a way that the best priced orders in the book are traded first when an order is entered into the order book. If there are multiple orders at the best price, the allocation scheme specifies how the quantity of the incoming order is allocated to those book orders. T7 supports the following allocation schemes: Time allocation, Pro-rata allocation, Time-pro-rata allocation.

3.3.1 Allocation schemes

- **Time allocation:** The quantity of the incoming order is allocated to the oldest book order first. If there is any remainder then it is moved to the next oldest order, until the quantity of the incoming order is exhausted or all orders at the best price have been executed.
- **Pro-rata allocation:** The allocated quantity of the incoming order is shared among all book orders at the best price. The allocation is proportional to the size of each book order. All book orders at the best price are considered in the allocation.
- **Time-pro-rata allocation:** The allocation of an individual order is based on its order size as well as on the order priority time, combining aspects of pro-rata and time allocation. In that way, best price orders with an older order priority time receive a higher share of the quantity of the incoming order, at the expense of orders with younger order priority times, and there are potentially less book orders involved, compared to the pro-rata allocation.

The allocation schemes applied to the derivatives markets can be different per product and instrument type. For the cash markets, the "Time allocation" scheme is used.

Please note that for Midpoint matching in the separate Midpoint order book a volume-price priority is applied.

3.3.2 Synthetic matching

Synthetic Matching is a functionality that is specific to derivatives markets. Also known as Implied Matching, it denotes the matching of orders from different instruments against each other. Besides the

normal Direct Matching of incoming orders against orders on the other side of the same instrument's order book, T7 supports synthetic matching of futures spread orders or inter-product spread orders against orders belonging to their leg instruments, as well as synthetic matching between orders from different futures spreads. See the Functional Reference for extensive descriptions of the various types of synthetic matching in T7.

3.3.3 Special On-Book Trading Services

- Eurex Improve: A client order flow execution facilitation service, also known as Client Liquidity Improvement Process (CLIP).
- Eurex Cross- and Pre-Arranged Trade facility: This service for on-exchange trading enables trading participants to provide all required information at the appropriate time while ensuring the time management and the compliance of announcements as required by Eurex Rules and Regulations, similar to Eurex Improve.
- Xetra Retail Execution Service.
- Xetra Midpoint offers the possibility to execute orders at the midpoint of the currently available Xetra best bid/best ask price in the Central Limit Order Book (CLOB).

3.4 Trade Traceability

T7 provides trade traceability, allowing orders to be linked to executions, trade confirmations, and trades in clearing and settlement. Please refer to the T7 Cross System Traceability document for detailed information.

3.5 Clearing and Settlement

Trade information of products marked for clearing via a central counterparty is forwarded for clearing and settlement to different Central Clearing Counterparties (CCPs) depending on product settings and / or participant's choice. The following is applied:

- C7 is the clearing system used for all Eurex and EEX products,
- Eurex Clearing acts as the default counterparty for all cash products which are CCP eligible.
- Participants have the possibility to individually choose an additional CCP per cash market among the CCPs approved by the exchange, besides the mandatory default CCP. Trades are forwarded to the additional CCP if certain conditions are met.

Trade information of products marked for non-CCP clearing are forwarded for settlement to Clearstream. For non-CCP cash instruments, the functionalities of bilateral aggregation and settlement internalization are available.

Please refer to the T7 Cross System Traceability document for further information.

4 TES (Off-book) Functionality

T7 Entry Service offers the functionality of entering pre-arranged trades into the exchange system. The price and quantity of an off-book trade is already agreed upon by the participants before the entry of the trade into the exchange system. This section describes key aspects of the TES functionality provided by the T7 trading architecture.

4.1 TES Types and TES Type Eligibility

For derivatives, the T7 Entry Service supports the following TES types:

- Block Trade - Supports the bi- and multilateral off-book trading of standard products.
- Exchange for Physicals (EFP) Fin – Supports bilateral off-book trading on futures products and a cash reference to specific bonds.
- Exchange for Physicals (EFP) Index – Supports bilateral off-book trading on futures products and a cash reference to an equity basket. Also Flexibles are allowed.
- Exchange for Swaps (EFS) – Supports bilateral off-book trading on futures products and a cash reference to a swap contract.
- Vola Trade – Supports bilateral off-book trading on futures products and a reference to an options off-book (Block TES trade) trade. On-book options trades are not allowed to be used as a reference for a vola trade.
- Trade at Market – Specific TES type for Total Return Futures products (TRF) and Variance futures. TRF contracts are associated with an underlying index, security, or fixed income product and replicate the daily performance of a Total Return Swap corresponding to the contract expiration.
- Eurex EnLight – A trade based on a previous Eurex EnLight Deal results in the TES Type Eurex EnLight.
- Qualified Third-Party Information Provider trade (QTPIP) – Entered by a registered third-party information provider (no Eurex exchange participant) and approved by any Eurex participant.

For cash instruments, the T7 Entry Service supports the following TES types:

- OTC – Over-the-Counter: Supports the bilateral, off-book *OTC* trading of cash instruments. Buyer and seller can enter the trades that they previously arranged with each other into the T7 system. Neither price nor quantity validations nor publication of the TES trade is performed. Pre-approved bilateral OTC Trade Uploads can be uploaded to T7 as a direct trade reporting without further approvals. Pre-approved bilateral OTC Trade Uploads are only available in the context of the German bilateral stock exchange trading,
- LIS – Large-in-Scale: Supports the bilateral, off-book but *on exchange* trading of cash instruments. Buyer and seller can enter the trades that they previously arranged with each other into the T7 system. On entry, several validations are conducted, e.g., price and quantity validations. After approval, the TES trade is published with a certain delay via EMDS. The deferred TES trade publication is performed according to MiFID/MiFIR requirements.
- Xetra EnLight – A trade based on a previous Xetra EnLight Deal results in an off-book *on exchange* trade of TES Type Xetra EnLight. The TES trade is published with a certain delay via EMDS. The deferred TES trade publication is performed according to MiFID/MiFIR requirements.

The TES type eligibility defines on business unit and user level if TES trading in one or more of the above-mentioned TES types is allowed. The supervisors of each business unit are able to assign the eligibility of certain TES types to the users belonging to their business unit. If users are eligible for the TES type “Block Trade”, they are automatically eligible for the TES type “Trade at Market”. This means that there is no independent TES type eligibility for “Trade at Market”.

4.2 TES Profiles

TES profiles support a configurable mapping between products and their instrument types on the one hand and TES types on the other hand. The TES profile will summarize all valid *product – instrument type – TES type – Minimum Expiry Range* combinations termed as TES profile key and corresponding TES profile attributes. The key is a combination of the product, instrument type and TES type.

For derivatives, the TES profile attributes consist of:

- Broker Allowed – This flag defines whether broker trades are supported or not.
- Max Participants - This field provides information about how many participants / TES approving users can be involved on both sides of a TES trade.
- Minimum Price Step – This field provides the information about the minimum price increment allowed for a TES trade.
- Minimum Lot Size – This field provides the information about the minimum TES side quantity allowed in a single leg.
- Minimum Lot Size Non Primary – Replaces Minimum Lot Size for non-flexibles without Primary flag set, if the Minimum Lot Size Non Primary is filled.
- Allow Auto Approval – This field decides whether TES Auto Approval is allowed or not.
- Non-disclosure Limit – This field provides the quantity threshold for using the non-disclosure feature.
- Leg Prices Allowed – This field provides the information whether it is allowed to provide prices for the leg instrument or not and if allowed whether the leg prices must always be provided.
- Price Validation Rule – The rule used for price validation of TES trades in accordance to “Conditions for Utilization of the T7 Entry Services”.

The TES profile attributes for cash markets are a subset of the TES profile attributes for derivatives markets, plus the Auto Approval attribute:

- Broker Allowed.
- Max Participants. – Always 2 for bilateral.
- Price Validation Rule.

The TES profile is published on the Web sites mentioned in section 1.2 (Further reading).

Example of a TES profile for derivatives (the actual configuration in production might be different):

Product	Instrument Type	TES Type	Min Expiry Range	Broker Allowed	Max Participants	Minimum Price Step	Minimum Lot Size	Minimum Lot Size Non Primary	Allow Auto Approval	Non-disclosure Limit	Leg Prices Allowed	Price Validation Rule
FDAX	Simple	Block	1	FALSE	2	0.5	250	250	Y	999999	Not Allowed	FUTURE SIMPLE INSTRUMENT
FDAX	Flexible	Block	1	FALSE	2	0.5	250	250	N	1	Not Allowed	FUTURE SIMPLE INSTRUMENT
FDAX	Simple	Vola	1	FALSE	2	0.5	1	1	Y	999999	Not Allowed	FUTURE SIMPLE INSTRUMENT
FDAX	Simple	EFP Idx	1	FALSE	2	0.5	1	1	N	999999	Not Allowed	FUTURE SIMPLE INSTRUMENT
FDAX	Calendar Spread	Block	1	FALSE	2	0.5	250	250	Y	999999	Allowed	FUTURES SPREAD
OGBL	Simple	Block	1	TRUE	30	0.005	100	100	N	999999	Not Allowed	OPTION SIMPLE INSTRUMENT
OGBL	Flexible	Block	1	FALSE	2	0.005	100	100	Y	1	Not Allowed	OPTION SIMPLE INSTRUMENT
OGBL	Standard Strategy	Block	1	FALSE	2	0.005	100	100	N	999999	Allowed	STANDARD OPTION STRATEGY
OGBL	Volatility Strategy	Block	1	FALSE	2	0.005	100	100	Y	999999	Allowed	OPTION VOLATILITY STRATEGY
OGBL	Non-standard Strategy	Block	2	FALSE	2	0.005	100	100	N	999999	Allowed	NON-STD OPTION STRATEGY

4.3 TES Activities

The following TES activities are supported by the T7 Trader GUI and by various T7 requests via the ETI interface:

- **TES Trade Entry:**
Enables the entry of a pending TES trade containing the general TES trade information which encompasses the instrument Id, the trade price, the traded quantity, the TES closure time or the text field "TES trade description". It also specifies all users involved on the buy and sell side of the TES trade (approving users).
- **TES Trade Modify:**
Allows the modification of a pending TES trade by its initiating user. As long as the TES trade is not approved by all of its approving users, the modification of the general TES trade information except instrument Id and external references is supported. This also includes the approving users and the number of the approving users involved on the TES trade sides.
- **TES Trade Delete:**
Allows the deletion of a pending TES trade by its initiating user.
- **TES Trade Approve:**
Allows the approval of a pending TES trade side by its approving user. All TES trade side specific information (e.g., trading capacity, open/ close indicator, text fields) needs to be specified. A TES trade also needs to be approved by the initiating user if the initiating user is identical to an approving user, i.e. if the user who was initiating the TES trade is also involved on any side of the same TES trade. – The auto approval functionality allows the participants to define criteria as TES Auto Approval Rules, which are used by the system to approve TES trades automatically. The TES Auto Approval Rules also provide the possibility to set pre-defined clearing and MiFID fields.

4.4 Clearing and Settlement

The clearing and settlement of TES trades works analogously to the clearing and settlement of on-book trades, see chapter 3.5.

5 Eurex EnLight

5.1 Overview

T7 provides Eurex EnLight, a selective request for quote service (SRQS), to negotiate off-book transactions electronically. The primary objective of the selective request for quote service is to find a counter party willing to execute a trade in the specific instrument with the negotiated price and quantity. The negotiated deal on Eurex EnLight is a non-binding agreement between two participants. It is not yet registered at the exchange as a binding trade. The Eurex EnLight deal is converted into a binding TES trade after a certain period of time.

Variants of the Eurex EnLight negotiation process are:

- Working Delta, where you can adjust price and quantity of an options trade after the deal is struck.
- Basis Trading, supporting outright futures trading by reducing the underlying delta risk of respondents.
- Eurex EnLight SMART Request for Quote, where a requester can target potential respondents who most likely have an interest in a specific RfQ.
- Eurex EnLight Anonymous Requests and Responses, where it is possible to negotiate deals and make trades without disclosing the identity of the requester and/or of respondents.

5.2 The Workflow in Eurex EnLight

The Eurex EnLight process workflow follows the Straight-Through-Processing negotiation model (STP), and it is divided in two parts: *Negotiation Event workflow* and *Deal workflow*.

5.2.1 Negotiation Event Workflow

The Negotiation Event workflow has the following steps:

1. The requester (typically a broker) sends an RfQ request to start a Negotiation Event. A termination time (T1) for the RfQ is set.
2. The targeted respondents (market makers) are informed about the start of the Negotiation Event with the details about the RfQ.
3. The respondents provide quotes and the requester receives information about each quote. The quote has to contain all the relevant information for a TES Trade including MiFID and clearing fields.
4. Based on the quotes received, the requester can decide to target a specific quote by sending an order (HitQuote) that results into a deal. The order has to contain all the relevant information for a Eurex EnLight Trade including MiFID and clearing fields

Figure 8 Eurex EnLight Negotiation Event Workflow

5.2.2 Deal Workflow

The Deal workflow in Eurex EnLight starts with the creation of a deal.

Figure 9 Eurex EnLight Deal Workflow

1. A deal is generated when an order is allocated to a quote side. The deal is communicated both to the requester and the respondent.
2. A deal generated within an *Indicative* Negotiation Event has the status *Pending*. The respondent can change the status from *Pending* to *Final* or to *Rejected*. The requester can change the status from *Pending* to *Rejected*.
3. A *Pending* deal can have a limited validity time. In case the validity time is reached, the deal is *Rejected* automatically.
4. For options, the requestor may allow the phase *Working* between *Pending* and *Final*. Here, the respondent is allowed to modify the options quantity of the pending deal according to certain rules and restrictions.
5. Once the status of the deal is changed to *Rejected* or *Final*, it cannot be updated anymore. A *Final* deal can be cancelled on mutual agreement.
6. All *Final* Eurex EnLight deals are stored / queued for further processing with a certain delay (T2). The time is communicated to the customers.
7. Upon expiry of T2, the Eurex EnLight *Final* deals are automatically converted to TES trades with TES type Eurex EnLight.

6 Xetra EnLight

6.1 Overview

T7 provides Xetra EnLight, a selective request for quote service (SRQS), to negotiate off-book transactions electronically. Xetra EnLight is an off-book on-exchange service that is MiFID II compliant.

Contrary to Eurex EnLight, a struck deal automatically results in a legally binding T7 TES trade without any further interactions by the counterparties. This T7 TES trade is of TES type *Xetra EnLight*.

6.2 Process Workflow in Xetra EnLight

The process workflow of the negotiation in Xetra EnLight has the following steps:

1. The requester uses an RfQ to start a Negotiation Event with selected respondents.
2. The respondents will be informed with all details of the RfQ.
3. In response to the RfQ, the respondents can provide quotes to the requester. Alternatively, the respondents may also answer with *working* or *declined* or even may not respond at all.
4. The requester may update the Negotiation Event. Respondents are informed about updates.
5. Respondents may update their quotes. The requester will be informed about updates.
6. Based on the quotes received, the requester can target a specific quote or opt for an allocation by which the best quote is selected automatically by Xetra EnLight.
7. When the requester sends an order to hit a quote, a deal is generated which automatically results in a TES trade of type Xetra EnLight.

Xetra EnLight Negotiation Event Workflow

7 Risk Protection and Safeguards

Risk protection and safeguard functions in T7 include:

- Transaction Size Limits (derivatives markets only) restrict the quantity at order and quote entry, and at entry of a TES trade. Individual transaction size limits are supported for on-book trading and off-book trading. They are configurable on exchange, clearing member, participant, TSL user group level, and user level, either per TSL product groups or per product and TSL type, depending on the level.
- Maximum Order Quantity (cash markets only) enables the participant to restrict the quantity at order and quote entry on user level. In addition, there are maximum order quantity limits set by the exchange which cannot be skipped by the participants.
- Maximum Order Value determining the maximum value of an order that a trader is allowed to enter. In addition, there are maximum order value limits set by the exchange which cannot be skipped by the participants.
- Market Maker Protection (MMP) mechanism which can prevent that too many quotes of a market maker match during a short period of time (derivatives markets only).
- Pre-Trade limits:
 - For derivatives markets:
 - For futures and options which set limits to the sum
 - of the netted (buy / sell) traded on-book quantity of the current day,
 - of open order and quote quantities of the current day on this side (buy / sell);
 and separately, for TES off-book trading, to the sum of:
 - of the netted (buy / sell) traded off-book quantity of the current day,
 - of the sum of not yet approved TES trades of the current day on this side (buy / sell).
 - For cash markets:
 - Based on the notional value of on-book orders, i.e. quantity * price.
- Overall Risk Limits (ORL) provide a specific risk protection mechanism for Sponsored Access (SpA) in cash markets. SpA providers can define Gross and Net Limits to restrict the trading volume of their SpA user companies.
- Clearing members may inactivate one of their DC market participants for a specific product, separately for on-book and off-book trading (derivatives markets only). In this case, all orders, quotes and / or pending TES trades of the DC market participant are deleted.
- Clearing members may stop a trading participant for whom they are designated clearing members. When a trading participant is stopped, the corresponding trading business unit in T7 is automatically stopped, and all orders and quotes within the business unit are deleted. Manual stop of trading can be applied to the whole participant, or to a business unit, or to an individual trader. Manual stop may also be performed by the exchange. (Cash markets only)
- Advanced Risk Protection functionality: It can provide warnings, slow or stop a participant if a predefined position limit is exceeded (derivatives markets only).
- Price validations for orders and quotes safeguarding that the limits entered are not done by accident or that the orders and quotes are executed at a price far away from the market without a notification to the traders or the market. An extended price validation cannot be skipped by the participants.
- Volatility Interruptions which interrupt trading by a volatility auction state to provide the customers

to adjust their orders due to the current market condition. Volatility interrupts are supported at instrument level for cash instruments, and at instrument and / or product level for derivatives products / instruments.

- Self-Match Prevention (SMP) functionality which prevents that own orders of the same instrument match against each other. Also a marketwide Self-Match Prevention among various participants is possible.
- Passive Liquidity Protection (PLP): Can be switched ON by the exchange for specific products. Then, incoming quotes are considered as BOC quotes, and incoming potentially aggressively matching orders can be deferred by a very small amount of time.

8 Interfaces

The T7 trading architecture provides participants a portfolio of interfaces: Gateways act as entry points for transactions, public market and reference data are distributed using multicast, additionally a GUI solution is offered.

One general design principle of the interfaces is to minimize the exchanges' effect on the participants. Except for the T7 GUI Launcher, participants do not need to install exchange hardware or software components, so that T7 can be accessed without the need for specific hardware, operating system, programming language, and compiler versions, as long as they support the general communication components, like TCP/IP and IP multicast.

The next figure followed by a brief overview describe all interfaces supported by T7. Please note that the availability of interfaces may differ on different trading venues.

Figure 10: T7 Interface Landscape

Trading Interfaces:

- **Enhanced Trading Interface (ETI):** ETI is the high-performance trading interface designed for Participants who require the highest throughput and the lowest latency. The ETI supports full trading functionality, including market making (quoting), T7 Entry Service and Eurex EnLight, Xetra EnLight.
- **FIX LF Interface:** The T7 FIX LF Interface uses FIX 4.4 protocol.
- **EDCI:** Enhanced Drop Copy Interface for the EDC Service.

Market Data:

- **Enhanced Order Book Interface (EOBI):** Provides the entire visible order book by distributing public and anonymous information on each individual order and quote in un-netted manner, along with all on-book executions and state information (i.e. *on-book information only*, no off-book data). For the derivatives markets, the EOBI include selected products only while for the cash markets, no selection of products takes place, but all instruments are considered.
- **Enhanced Market Data Interface (EMDI):** Provides un-netted price level aggregated market data for *on-book* and *TES trading* using multicast technology.
- **Market Data Interface (MDI):** Provides netted price level aggregated market data using multicast technology.

- **Extended Market Data Service (EMDS):** This interface provides intraday settlement prices, adjusted open interest, trade prices and underlying ticker data for the derivatives markets. For the cash markets, the EMDS include all trade prices as well as underlying data like indices (T7 ticker), and cash TES trades of type LIS.

Reference Data:

- **Reference Data Interface (RDI):** This interface provides reference data via high bandwidth connections, including intra-day updates which is relevant for derivative products only. Intraday updates (created/ deleted complex instruments) are also disseminated via MDI and the incremental channel of EMDI.
- **Reference Data File (RDF):** Reference data is also delivered as a start-of-day file (RDF) including updated intraday files for incrementals (for derivatives).
- **Reference Data via webpage:** Reference data is provided via the internet on www.eurex.com and cashmarket.deutsche-boerse.com.

Graphical User Interfaces (GUIs)

- **GUIs (Trader/ Admin/ Clearer):** Graphical user interfaces for basic trading functions (Trader GUI) such as order maintenance, TES and Eurex EnLight, Xetra EnLight. Quoting is not supported. The Admin GUI is provided for administration functions, such as for user maintenance, for example. The Clearer GUI is designed for the derivatives and cash markets, to manage the back-office departments and the clearing risk functions (e.g., clearing member stop button functionality).

Reports

- **Common Report Engine:** Trading reports, audit trail reports, and the reference data file are provided exclusively via the common report engine.

The following table illustrates, as a summary, which functions are supported by each interface:

	Core Trading ¹	Market Making ²	Info ³	T7 Entry Services ⁸	Eurex / Xetra EnLight	Market Data	Reference Data	Admin ⁵	Reports	Clearing Member Stop/Release
ETI	✓	✓	✓	✓	✓					
FIX LF	✓		Private risk control messages							
EDCI			✓ ⁹							
MDI						✓ ⁴	New & deleted complex and flexible instruments			
EMDI						✓ ⁴	New & deleted complex and flexible instruments			
EOBI						✓ ⁷	New & deleted complex instruments			
EMDS				✓ But not type OTC	✓	Intraday settlement prices, open interest, underlying ticker data, trade prices, indices				
Trader GUI	✓	Only quote deletion, activation/deactivation, protection maintenance	✓	✓	✓	✓	✓			
Admin GUI		Protection Maintenance						✓		
Clearer GUI			Private Trade Info					✓		✓
RDI							✓			
Common Report Engine							✓		✓	

Table 13: Overview of Interfaces and Functions

¹ Order management, trade confirmations, complex instrument creation, cross request, quote request.

² Quote management, market maker protection.

³ Public news, private risk control messages.

⁴ Public market data, on-book and off-book trade information (derivatives only); product and instrument states, quote and cross requests.

⁵ User maintenance, password maintenance, PIN procedure, trade enrichment rule, stop trading, risk control actions.

⁷ Does not provide off-book trade information.

⁸ TES trade management, TES trade approval.

⁹ Order entries, modifications, cancellations, executions, retransmissions, Trader Stop.

8.1 Trading Interfaces

There are two types of trading interfaces: The Enhanced Trading Interface (ETI) and the FIX LF Interface. Both interfaces are session-oriented, and participants must order their sessions from the exchange via the respective member portal. Participant applications are connected to the trading system by opening a TCP session to an application gateway. In addition to the two trading interfaces, there is the Enhanced Drop Copy interface to receive the order stream of a Business Unit.

The Session Details List message is transmitted either on request (ETI sessions) or as the first message after a successful login (FIX LF Backoffice sessions). It includes all sessions assigned to the participant ID. In addition to that, this list includes session IDs for the GUI, which can also be used to subscribe for listener data over ETI. Please note that the GUI session IDs are static internal IDs, and do not relate to how many GUI sessions a member has running concurrently.

8.1.1 The Enhanced Trading Interface

The Enhanced Trading Interface (ETI) is the high-performance trading interface designed for Participants who require the highest throughput and lowest latency.

A Participant must establish a TCP session to connect to T7. All application messages exchanged between the client and the ETI are close to the FIX V5.0 SP2 semantics, including all officially approved extension packs. A proprietary session layer is used to provide the highest flexibility.

ETI provides all trading functions of T7:

- Order handling for simple and complex instruments.
- Additional support of short order message layouts for simple instruments, which applies streamlined functionality to achieve a comparable latency to quotes.
- Quote handling, including quote inactivation, for simple and complex instruments.
- Execution notifications.
- Market maker protection mechanisms (derivatives only).
- Creation of complex instruments (strategies, derivatives only).
- Request for quote.
- Cross request.
- TES entry, modification, deletion and approval.
- Eurex EnLight.
- Xetra EnLight.
- Eurex Improve.
- Knock-out and Sold-out of instruments.

ETI enables Participants to subscribe to private trading data in broadcast form:

- Drop copy of order events other than for lean orders (optional subscription).
- Trade confirmation at a business unit level (optional subscription).

The following trading support information is available for each session:

- News messages from the exchange (optional subscription).
- Private risk control messages (always sent).

For Specialists trading in the *Continuous Auction with Specialist* trading model, ETI provides specific information:

- Order book data (with Trailing Stop order updates).
- Instrument state changes.
- Specialist end of restatement message during Start-Of-Day.
- Start and End-of-Assignment in case the specialist for an instrument is changed intraday.

For Issuers trading in the *Continuous Auction with Issuer* trading model, ETI provides specific information about potential auction prices, executables volumes, and auction imbalances.

ETI does not provide any market data, reference data, or administrative functions.

ETI is a session-oriented interface. ETI responds to each request on the same session after the request was submitted and also sends unsolicited messages when there are changes or executions to any orders and quotes entered on that session.

ETI is based on the following general concepts:

- Trade confirmations are the only legally binding information that a trade has occurred.
- Orders are owned by the user.
- Lean orders can only be modified through the same session, where they had been entered previously.
- Quotes are owned by the session.
- Order and quote responses as well as execution messages do not completely echo the data of the original order. Hence Participant applications should save the details of each order and quote sent.
- No state recovery (inquiry) is supported; Participant applications must keep track of the order book and use retransmission recovery and the order book replay, which is sent at start-of-day and in case of an exchange system failure (i.e. market reset).
- No messages from previous days are offered via ETI.
- For quotes and lean orders, only the execution notifications and unsolicited events are recoverable.
- For standard (non-lean) orders all order events are recoverable.
- A listener broadcast contains order events for standard orders but not for lean orders (refer to 3.1).
- Eurex EnLight quotes and Xetra EnLight quotes are non-recoverable.

ETI supports two session types: high-frequency (HF) and low-frequency (LF) sessions. Both session types differ in functionality:

- A HF session supports lean orders (non-persistent) as well as standard orders (persistent and non-persistent), but an HF session does not support the subscription of broadcasts.
- A LF session restricts the possible frequency of Eurex resp. Xetra EnLight quotes.
- A LF session may also be used for the receipt of broadcasts; for example, listener broadcast or trade notifications at a business unit level/ clearing member level. Orders in a LF session can be persistent or non-persistent, standard (non-lean) or lean, refer to 3.1. TES and Eurex or Xetra EnLight requests are only supported via LF sessions.

To protect its trading system, T7 has several measures in place to ensure that its most vital components are not harmed by a malfunctioning client application. In particular, the following technical transaction limits (throttle) are used for the respective combinations of environment, session type and capacity type:

Environment	Session type	Capacity type	Transactions/sec
Production	HF	Ultra	250
	HF	Full	150
	HF	Light	50
	LF	Full	150
	LF	Light	50
Simulation	HF	Ultra	20
	HF	Full	20
	HF	Light	20
	LF	Full	20
	LF	Light	20

Table 14: Transaction Limits in Production and Simulation

Additionally, all ETI sessions have an assigned disconnection limit of:

- 750, i.e. in case of more than 750 consecutive rejects due to exceeding the technical transaction limit for sessions with a throttle value of 250 txn/sec.
- 450, i.e. in case of more than 450 consecutive rejects due to exceeding the technical transaction limit for sessions with a throttle value of 150 txn/sec.
- 150, i.e. in case of more than 150 consecutive rejects due to exceeding the technical transaction limit for sessions with a throttle value of 50 txn/sec.

For both limits all technical transactions are counted using a sliding window.

For Eurex and Xetra EnLight, a specific EnLight throttling is in place:

- For LF quotes, only one Enter Quote request per 200 milliseconds is allowed. Throttling is handled per negotiation. The deletion of quotes is not throttled, therefore quote deletion is always possible.

- For HF quotes, there is no throttling, the publishing of quote notification broadcasts is netted (1x per second).

Please note that in Eurex EnLight all quotes are LF quotes, while Xetra EnLight supports LF and HF quotes.

For more information see the *Deutsche Börse's T7 - Insights into trading system dynamics* presentation, which can be found at these places:

eurex.com > Support > Technology > T7 (below at Supporting documents)

cashmarket.deutsche-boerse.com > Technology > T7 trading architecture > Publications

Dedicated back-office ETI LF sessions are available to receive trade and listener broadcasts. This session type cannot be used to enter order/ quotes.

Please refer to the *T7 Enhanced Trading Interface (ETI) Manual* for further details.

8.1.2 The T7 FIX LF Interface

The FIX LF Interface is intended for establishing a standard FIX connection to the exchange.

The T7 FIX LF Interface uses FIX 4.4 protocol. Self-Match Prevention (SMP) is available. There is no TES entry and no TES maintenance, but only TES notification about TES trades entered via other interfaces. Eurex Improve is available.

Please refer to the *T7 FIX LF Manual* for further details.

8.1.3 Enhanced Drop Copy Service

Eurex, EEX and Xetra offer an Enhanced Drop Copy Service (EDC) via the EDC Interface (EDCI), providing a comprehensive overview of all orders including lean orders. All changes to an order occurring on the current business day are broadcast. This includes new order entries, modifications, cancellations, or executions. The order data is broadcast near real time. The data includes only orders and is based on a basic set of FIX attributes known from the existing order message layouts.

The EDC broadcast can be consumed by trading participants for the activities of their own business unit, as well as by clearing participants who are interested in receiving order information about their NCMs. SpA Providers have to set up at least one EDC monitoring session per SpA User Company to allow them to trade. Access of clearing participants to NCM order data is subject to an authorization approval by the respective trading participant. Specific EDC monitoring sessions allow an automatic trading stop on session loss. The trading stop can be triggered via EDCI interface, too.

The EDC service offers a retransmission functionality.

For more information, see the *T7 Enhanced Drop Copy Interface Manual Derivatives / Cash*.

8.2 The Market Data Interfaces

Public market data is available using multicast interfaces. All data feeds are distributed over several IP multicast addresses which are available via RDI/ RDF.

8.2.1 Market Data Interface (MDI) and Enhanced Market Data Interface (EMDI)

The Enhanced Market Data Interface (EMDI) offers un-netted market data and TES trade data (i.e. *on-book* and *off-book* data) and requires a high bandwidth connection. Market Data Interface (MDI) offers netted market data, with fewer order book and trade updates, requiring a lower bandwidth connection.

The EMDI and MDI feeds follow FIX 5.0 SP2 semantics and are FAST encoded. EMDI uses out-of-band recovery, while MDI uses in-band recovery.

The following information is provided:

- Netted (MDI) and Un-Netted (EMDI) price level aggregated market data. Less price levels are provided on the MDI feed, which can be different to the number provided on the current trading system.
- Product state and instrument state information.
- On-book (derivatives and cash) and TES (derivatives only) trade information (EMDI: individual trade information, MDI: trade statistics only such as high, low, last etc.). Eurex EnLight TES trades, but not Xetra EnLight TES trades.
- Quote requests and cross requests.
- Description of complex instruments created intra-day.
- The Market Data Interface consists of incremental messages (event driven) and snapshots (periodically generated; not sent contiguously for all instruments of a product) which is delivered via one channel (in-band).

Please refer to the *T7 Market and Reference Data Interfaces Manual*, which contains further details on the interface.

Please note that EMDI is not available for Deutsche Börse Frankfurt.

8.2.2 Enhanced Order Book Interface

Enhanced Order Book Interface (EOBI) provides the entire visible order book by publishing information on each individual order and quote, along with executions and state information. It is the most granular source of on-book market data. At the same time, EOBI provides also information on TES trades in the same way as EMDI.

The EOBI requires a 10GB connection and is available in co-location installations only.

The T7 EOBI interface is enabled for all derivatives markets, for all instruments on XETR, and for a part of the instruments on XFRA.

The EOBI feed is distributed in the form of fixed length binary messages, without any compression, and uses out-of-band recovery. Most of the functional concepts used are similar to those of EMDI, however the EOBI provides greater transparency, together with a high throughput at minimal latency. The following information is provided on the EOBI, depending on order book disclosure settings:

- Order book information, disseminated without any depth limitation.

- The side, price, priority timestamp and displayed quantity of each visible order and quote.
- Trade prices and traded quantity for each executed on-book trade, with information about the possibly remaining aggressive quantity in the book.
- TES trade information in the same way as EMDI (derivatives only), with Eurex EnLight TES trades, but not Xetra EnLight TES trades.
- Product state and Instrument state information.
- Quote requests and cross requests.
- Intra-day changes regarding complex instruments.

The required reference data information of products enabled for EOBI is available via the Reference Data Interface (RDI) feed and the Reference Data Files (RDF). Please refer to the *T7 Enhanced Order Book Interface Manual*, which contains further details.

8.2.3 Extended Market Data Service

Participants and CEF ultra+ clients can receive via multicast the following:

- Intraday settlement prices (derivatives only).
- Open interest information (derivatives only).
- Underlying ticker data (derivatives only).
- Trades prices.
- Indices (cash only).
- TES trades (cash and derivatives), possibly deferred according to MiFID/ MiFIR requirements. This includes Eurex *and* Xetra EnLight TES trades. Excluded are cash trades of TES type OTC.

8.3 Reference Data

The following public reference data is provided to Participants:

- Product information.
- Instrument information (simple and complex instruments).
- Settlement prices and open interest from the previous day (derivatives only).

Information is provided for published and active, but not for delisted products/ instruments.

Please refer to the *T7 Market and Reference Data Interfaces Manual*, which contains further details on the interface.

8.3.1 Reference Data Interface (RDI)

The Reference Data Interface (RDI) distributes data over a number of IP multicast addresses via high bandwidth connections. All feeds follow FIX 5.0 SP2 semantics and are sent with FAST encoding. Information is provided as regular snapshots containing information as of the beginning of the day and as incremental messages for intra-day updates³. For intra-day recovery purposes, the snapshots are repeated during the day. It uses the same technical means as the market data interfaces.

8.3.2 Reference Data File (RDF)

Reference Data Files (RDF) are provided at the beginning of the day for derivatives and cash markets with the full set of products and instruments. Additional Reference Data Files with updates are provided at fixed intervals during the exchange trading day, containing intra-day created/ deleted complex instruments (derivatives markets only) or information about activated covers (cash markets only). The files are available on the common report engine (CRE).

For cash market Deutsche Börse Frankfurt, separate RDF files are provided.

8.3.3 Cash-specific reference data files

Cash-specific reference data files are provided along with the Reference Data Files (RDF).

- An All Tradable Instruments file is provided for Deutsche Börse Xetra.
- An All Tradable Instruments file is provided for Deutsche Börse Frankfurt, including structured products listed at Deutsche Börse Frankfurt.

8.3.4 Reference Data in the market data interfaces

All information about intra-day created complex instruments is also provided in the EMDI, MDI and EOBI (derivatives markets only).

³ Derivatives markets: Created / deleted complex instruments; including flexible instruments.

Cash markets: Activated instrument covers.

8.4 Graphical User Interfaces

8.4.1 Java-based GUIs

The Graphical User Interfaces (GUIs) provide exchange Participants with trading, market data and administrative and clearing related functions. The GUIs are started by the *T7 GUI Launcher* which is a customized seamless solution offered by Deutsche Börse to start a GUI and automatically receive updates. Additionally, Deutsche Börse offers a Java SE 8 Runtime Environment without additional Java license charges to be used exclusively with the T7 GUI applications. The T7 GUI Launcher and the Java SE 8 Runtime Environment are provided to the participants via the member section.

The GUIs can be accessed by standard leased lines or via the internet. For authentication, user/ password methods, and client certificate (only for internet access) technologies are used.

The Trader GUI provides access to the following functions for products and instruments traded on T7:

- Market overview and depth for simple and complex instruments.
- Display of theoretical prices (derivatives only).
- Maintenance of standard (non-lean) orders.
- View of standard (non-lean) orders of the business unit.
- Execution information for on-book trading of the business unit.
- Display of underlying ticker.
- Creation of complex instruments (derivatives only).
- Request for quote.
- Cross requests.
- The setting of market maker protection parameters (derivatives only).
- Quote deletion and activation/ deactivation.
- Emergency risk control functions (panic cancel and stop/ release button).
- Private risk control messages.
- General messages from the exchange.
- T7 Entry Services.
- Eurex EnLight Services.
- Xetra EnLight Services.

Entry or query of Quotes or lean orders is not supported.

For more information on the GUIs please refer to the *T7 Cash respectively T7 Derivatives Markets Trading + Admin GUI & Clearer GUI - User Manual*.

8.4.2 Web Browser-based GUIs

Beginning in 2025, Deutsche Börse has started to introduce step by step a new generation of Web browser-based graphical user interfaces (GUIs) for the T7 trading system. These new Web browser-based GUIs are designed to enhance the user experience and to simplify maintenance.

The Web Browser-based GUIs will stepwise replace the Java-based GUIs covering the full functional

scope of the Java-based GUIs (see above).

For further information please see the *T7 Web GUI project page* under *eurex.com > Initiatives and Releases*, respectively under *cashmarket.deutsche-boerse.com > Data and Tech*.

Please refer to the *T7 Web App Connectivity Guide* for technical details on how to connect to the T7 Web GUIs. Additionally, the *N7 Network Access Guide* has a chapter on featuring IP addresses and URLs for the T7 Web App family.

The Admin GUI contains the following functions:

- Administrative functions, such as the creation of users, assignment of entitlements and transaction size limits.
- Trade enrichment rules setting.
- Emergency risk control functions (panic cancel and stop/release button).
- EDC access and session management.

The Clearer GUI contains the following functions for cash markets:

- Administrative functions for clearing.
- Display of trades of related trading participants.
- Clearing Member stop functionality with deletion of orders/ quotes of halted participant.

and for derivatives markets:

- Trades from DC market participants.

and for derivatives and cash markets:

- Pre-Trade Risk limits maintenance.
- EDC access and session management.

8.5 XML Reports

Trading reports, audit trail reports, and reference data files are provided via the Common Report Engine (CRE), where they can be retrieved by Participants. Please note that the reports differ in the layout for derivatives and cash products.

For details, please refer to the *T7 XML Report Reference Manual*, and to the *Common Report and Upload Engine User Guide*.

9 Change log

Version	Date	Changes
15.0 Version 1	August 17, 2026	• 2.4.1 Sponsored Access Enhancements. • 3.1 New Midpoint Order Trading Restrictions MBO and CRT. • 7 Overall Risk Limits: New risk mechanism for Sponsored Access in cash markets. • 8.1.3 EDC Enhancements: Monitoring sessions and Retransmission. • 8.4 GUI: Java-based Admin GUI decommissioned and replaced by Web Browser-based GUI.
